

I spent almost all time i have been assigned for this task without dilly dalliying.

As i sad during preliminary phone call, i only heard of Magento. I did know it's some sort of e-commerce platform/framework written in php.

I modified following files:

1. app/design/frontend/rwd/default/template/page/html/header.phtml.

In this file, i commented out original code, which i needed to modify to fulfill task set upon me.

Tag that had class="header-language-background" was unnecessary since in picture you provided language menu wasn't included.

Added couple more surrounding tags to properly style front page elements.

2. app/design/frontend/rwd/default/template/page/html/topmenu.phtml.

There i added a php call and additional li element to create home element inside a navbar.

Rest lies unchanged.

3. CSS.

Everything under commented line `/* Custom by moa */` is either my modifications of existing css code or additional code that i have been created. Only css file which is modified is skin/frontend/rwd/default/css/styles.css.

Concerning css and styling, since because lack of time, some of css code is inline. Sorry 'bout that ...

3. In admin panel>CMS>Pages>Madison Island/home->content is a lot of inline css. That's also because lack of time. No other page has been modified.

4. admin panel>CMS>Static blocks>Footer Links SM/footer_links_sm is also been modified. Since i done that last, css wasn't very good.

5. XML. Since i never used it, nor code that looks awfully familiar like Angular.js which i also never used, most of modifications are copies of original, now commented out code. Modification was done with under-knowledge and advices taken mostly from SO and other online resources. I'm going to say it again, i have no previous experience with either XML not what it loks like Angular. Only used my deduction and common sense. And advice about these two, lots of it!

XML files that have been modified:

- app/design/frontend/rwd/default/layout/newsletter.xml
- app/design/frontend/rwd/default/layout/checkout.xml

- app/design/frontend/rwd/default/layout/catalog.xml
- app/design/frontend/rwd/default/layout/page.xml
- app/design/frontend/rwd/default/layout/catalogsearch.xml
- app/design/frontend/rwd/default/layout/customer.xml, but in this file i added lines from 56-60

Addendum: Most of my time spent was on acquiring right sample data for the project, almost a day. Second a day was spent on configuring Magento and figuring out how it works. Rest is spent on coding and thinking how to get certain element i.e. finding the right selector to get it. One of the trouble is not being able to acquire element using either vanilla javascript or JQuery for that matter ...

This is my first time using Magento, let alone Zend framework nor i ever used MVC paradigm also i also know what it is ...

I stand by my claims said in my cv. I didn't claimed other things, just thing stated in it which are true.

PS: In email message you stated till friday at noon, yet in pdf document provided in this email, stated deadline is three days ...
